

GREENWARD

FIELD GUIDE

Offline illustrated guide for Sana Vey's garden crew

Tutorial Presentation

Kairova Tech Department → Greenward

Route • Prototype • XAML/C# • Testing •
Team Roles

Windows WPF application • Designed to work when the network drops

Project Mission & Story Context

What the Greenward crew needs and what the application is designed to accomplish.

MISSION

Give Sana Vey's garden crew a simple field guide that still works on an ordinary Windows computer when the network is unavailable.

Story setting

- Beyond the protected pods, the forest has consumed roads and buildings.
- The guide helps the reader identify the route and important locations.
- This is a different team from Malik's earlier unresolved experience.

USER STORY

As a reader, I want to move through Sana's story and field route, so I can identify the garden area and understand the overgrown surroundings.

Reader goal

- Start the guide.
- Follow the Greenward route.
- Read the Garden Area information.
- Reach the Overgrown Area and identify the route.

Reader Route: Home → Map → Garden → Forest

The page number is the application's state.

Navigation rule

Start Guide sets page = 1. Next increments. Back decrements. Home resets to 0.

Boundary guards keep the reader between page 0 and page 3.

Prototype Evidence

1 • Welcome / Start Guide

2 • Greenward Route

3 • Garden Area

4 • Overgrown Area

Final UI Evidence

1 • Welcome / Start Guide

2 • Greenward Route

3 • Garden Area

4 • Garden Area (Function 1)

5 • Garden Area (Function 2)

6 • Overgrown Area

XAML: Building the Screen

XAML defines the visual controls; x:Name lets C# access them.

MAIN STRUCTURE

XAML is used to design the visual layout of our Greenward Field Guide. It creates the buttons, text, colors, and different pages, such as Home, Map, Garden Area, and Overgrown Area.

Navigation controls

BackButton • NextButton • HOME

XAML → C#

The names in XAML are the connection points used by C#.

HomePage	→	Visibility
MapPage	→	Visibility
GuidePage	→	Visibility
GuideTitle	→	Text
GuideImage	→	Text
GuideDescription	→	Text
BackButton / NextButton	→	IsEnabled

C#: The Page State

One variable keeps track of where the reader is.

CURRENT PAGE

C# controls the application's behavior when the user interacts with the buttons. The `currentPage` variable tracks which screen the reader is viewing, while the `ShowPage()` method displays the correct page. Methods like `NextButton_Click()`, `BackButton_Click()`, and `HomeButton_Click()` allow users to navigate through the guide.

Page states

- 0 Home
- 1 Map
- 2 Garden
- 3 Overgrown

NAVIGATION METHODS

StartGuide_Click	<code>currentPage = 1</code>	Home → Map
-------------------------	------------------------------	------------

NextButton_Click	<code>if < 3, then ++</code>	Next page
-------------------------	---------------------------------	-----------

BackButton_Click	<code>if > 0, then --</code>	Previous page
-------------------------	---------------------------------	---------------

HomeButton_Click	<code>currentPage = 0</code>	Return Home
-------------------------	------------------------------	-------------

Every navigation event finishes by calling `ShowPage()`.

ShowPage(): The Controller Method

It hides every page first, then displays the correct one.

STEP 1

Hide everything

The code hides the HomePage, MapPage, and GuidePage by setting their visibility to Collapsed. This ensures only the correct screen is displayed.

This prevents multiple screens from being visible at once.

STEP 2

Choose the page using currentPage

The currentPage variable determines which screen appears. Page 0 shows Home, page 1 shows the Map, page 2 shows the Garden Area, and page 3 shows the Overgrown Area. The code also updates the guide text and controls the Back and Next buttons.

Finally: BackButton.IsEnabled and NextButton.IsEnabled use the page boundaries.

Complete Event Flow

This is how a user action travels from the XAML button to the visible screen.

Example: NEXT on the Map page

currentPage = 1 → 2 → ShowPage() → Map hidden → GuidePage visible → “Garden Area” displayed

This same pattern is reused for every navigation button.

Demo & Functional Test Plan

What should be demonstrated with the current code.

1	Launch	Home page appears; START GUIDE is visible.	PASS when HomePage is visible.
2	Start Guide	Click START GUIDE → Map page appears.	currentPage becomes 1.
3	Next	Map → Garden → Overgrown.	Pages 2 and 3 display correct text.
4	Back	Move back one page.	currentPage decreases.
5	Home	Return to Welcome screen.	currentPage becomes 0.
6	Boundary	Back disabled at 0; Next disabled at 3.	Reader cannot leave valid range.

Important: the supplied code does NOT yet include CaptureService / CaptureButton_Click. Those are 7B tasks to implement and test next.

Final Submission Checklist

Everything needed for a clean instructor review.

✓	APPLICATION	Release build runs successfully on Windows.
✓	PROJECT ROOT	StoryGameApp/ • Evidence/ • README.md
✓	CLEAN ZIP	Exclude bin/ • obj/ • .vs/ and keep package under 100 MB.
✓	EVIDENCE	7A + 7B evidence organized with screenshots and test decisions.
✓	README	Intended User • Purpose • Setup • Controls • Code Map • Limitations • Contributions.
✓	TUTORIAL	Editable .pptx plus PDF in Week7/Evidence/Final/.
✓	PEER VERIFY	Outside peer extracts release ZIP, runs README steps, and records verification notes.
✓	REPOSITORY	Instructor can access the repository and tested URL is submitted.

READY = working app + tested navigation + complete evidence + clear documentation + final package.

Member-by-Member Master Checklist

Clear ownership from 7A through final submission.

LEXXIE**Lead Developer & Git Manager**

- ✓ 7A WPF project, XAML/C# alignment, Git checkpoint
- 7B CaptureService integration and clean build
- Final Release Build and clean ZIP
- Repository visibility/access and tested URL

NICO**Logic Architect & Visual Designer**

- ✓ 7A narrative flow and digital prototype
- 7B capture logic trace and prototype update
- Final code/event walkthrough
- Co-verify UI scaling and alignment

PAULINA**Narrative Writer & Documentation Lead**

- ✓ 7A Greenward storyline, user story, accessibility text
- 7B lecture notes and evidence organization
- Final README
- Final PPTX + PDF export

RUDY**Asset Pipeline, QA Tester & AI Lead**

- ✓ 7A image assets and boundary testing
- 7B capture tests + Required AI Check
- Final source/image credits
- Independent peer verification
